                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAH43389-93 encode protein tyrosine phosphatase
C (PPPase) polypeptides. The PTPase polypeptides, or the cDNA encoding
them, are useful for preventing, treating or ameliorating a medical
c condition in a mammalian subject. They are useful for diagnosing,
preventing or treating neural disorders (e.g. Alzheimer's disease,
c parkinson's disease), immune system disorders (e.g. rheumatold
c arthritis, Grave's disease), muscular disorder, reproductive
c disorders, pulmonary disorders, cardiovascular disorders
c (e.g. arrhythmlas), infectious diseases (e.g. viral hepatitis),
c (hyperproliferative disorders (e.g. neoplasms), diseases at the cellular
c level (e.g. multiple sclerosis), endocrine disorders (e.g. diabetes
c mellitus), and wound healing and epithelial cell proliferation.
C They are also useful for preventing hair loss, to prevent skin aging
c due to sunburn, to maintain organs before transplantation, to modulate
c mammalian characteristics, to treat weight disorders, to change a
c mammaliar mental or physical state, or as a food additive or

The present sequence is human protein phosphatase (PP)-4 cDNA.

CP PP polynucleotide and polypeptide are useful in the diagnosis,

CC treatment and prevention of immune system disorders, neurological

CC disorders, developmental disorders and cell proliferative disorders.

CC Examples of immune system disorders include acquired immune deficiency

CC syndrome (AIDS), severe combined immundeficiency disease (SCID),

CC adult respiratory distress syndrome, allergies, amyloidosis,

CC anaemia, asthma, atherosclerosis, Crohn's disease, atopic

CC dermatitis, diabetes mellitus, emphysema, Goodpasture's syndrome, gout,

CC Graves' disease, multiple sclerosis, myasthenia gravis, myocardial or

CC pericardial inflammation, osteoarthritis, osteoporosis, pancreatitis,

CD goorlasis, Reiter's syndrome, rheumatoid arthritis, Sjogren's syndrome,

CC scleroderma, systemic sclerosis, trauma; neurological disorders include

CC clarbeimer's disease, mental retardation and other developmental

CC disorders of central nervous system such as Down's syndrome, cerebral

Novel polypeptide, useful for diagnosing, treating or preventing disorders of growth and development, immune system, neurological cell proliferation diseases, comprises cancer protein phosphatase

and

2002-090206/12.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         palsy, periodic paralysis, mental disorders including mood, anxiety, and schizophrenic disorders, seasonal affective disorder such as akathesia, amnesia, catatonia, dyskinesia; developmental disorders include e.g. renal tubular acidosis, Duchenne and Becker muscular dystrophy, gonadal dysgenesis, hypothyroldism; cell proliferative disorders include e.g. actinic keratosis, arteriosclerosis, and cancer including adenocarcinoma, leukaemia. The polypeptide and polynucleotide are further useful for analysing proteome of a tissue or a cell type, for screening an agonist/antagonist, a compound that specifically binds to it or its modulator. The polynucleotide is useful for creating knockin humanised animals (pigs) or transgenic animals (mice or rats) to model human disease, for generating a transcript image of a tissue or cell type, which represents the global pattern of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1914 BP; 565 A; 378 C; 438 G; 533 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                    CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags of or identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) as useful in gene therapy techniques CC (II), (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC art from wino (II) and (III) and (III) are useful from WIPO of the format directly from WIPO.

PTPO10, ALP and ALK-7 proteins. The CC present sequence encodes mouse PTPO5. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify CC substances that modulate their activity (i.e. agonists and antagonists, CC including NBP) in vivo or in vitro. These substances are used to treat CC or prevent diseases associated with abnormal signal transduction CC pathways that involve the proteins, particularly cancer (e.g. leukaemia CC and lymphoma), while modulators of ALK-7 (which is a type I receptor CC serine/threonine kinase) are used to promote neuronal survival, CC diseases. Nucleic acid fragments of the polynucleotides encoding the CC proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

                                                                                                                                                                                                                    ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (1.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence encodes mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction
                                                                                                                                                                                                                                                                                                                            11-JUN-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathles and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, and contains a containing

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2689 BP; 713 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI99912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5425 BP; 1430 A; 1339

cc sequence complementary to nucleotides 537-653 of the SH-PTP1 gene cclone given as ANT35306 is used as a probe to detect a chromosome clap13 abnormality associated with neoplastic disease, in partic. Cc acute lymphoblastic leukaemia. The probe hybridises to a part ccondition for the two tandem SH2 domains (see AAR99312). Cc if the probe will not hybridise DNA of chromosome 12p13 from a patient csample it is indicative of an abnormality, normally associated with cc neoplasia. Fragments of sequences encoding human SH-PTP2 (see AAT35307) cc may also be used to diagnose a condition or susceptibility to a condition associated with chromosome 12p abnormalities. Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or protein may be used for comparison to sequenced PTP genes taken from a patient, where comparison to sequenced PTP genes taken from a patient, where comparison to sequenced by mutation to effect a change in megakaryocyte function and hence platelet production.
                                                                                                                                                             Alignment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT35308 is a rat cDNA sequence encoding MIPTP (protein tyrosine phosphatase-1). This sequence was used as a probe to isolate a series of overlapping human cDNA clones defining the human MIPTP equivalent, SH-PTP1 which contains two tandem SH2 domains. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Freeman RM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            26-JUN-1991;

                                                                    tyrosine phosphatase-1, with two SH2 domains) obtained from a human cerythroleukaemia cell line. The variant sequence lacks a sequence of two nucleotides, AG, corresponding to positions 1868 and 1869 of the wild-type sequence (see AAT35306). A fragment complemetary to the sequence from nucleotides 537-653 is used as a probe to detect a chromosome 12p13 abnormality associated with neoplastic disease, in partic. acute lymphoblastic leukaemia. The probe hybridises to a part of the region coding for the two tandem SH2 domains (see AAR99312). If the probe will not hybridise of chromosome 12p13 from a patient sample it is indicative of an abnormality, normally associated with neoplasia. Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or protein may be used for comparison to sequenced PTP genes taken from a patient, where differences indicate an abnormality. The activity of SH-PTP1 may also be purposely altered by mutation to effect a change in megakaryocyte function and hence platelet production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-FEB-1994;

                                                                                                                    The present invention relates to an activated SH2 (Src Homology-2) -domain containing protein tyrosine phosphatase (SHP-1 or SHP-2) mutant with a mutation in the SH2-domain. Activated mutants of SH2-domain-containing protein tyrosine phosphatases are useful in in vitro assays to screen for binding partners and inhibitors of the phosphatase and in the treatment of PrP-mediated diseases or conditions in a mammal, including neoplastic disorders, obesity and to inhibit angiogenesis. Inhibitors identified using the activated mutants are useful for the treatment of cancer, immunosuppression,

                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an activated SH2 (Src Homology-2) -domain containing protein tyrosine phosphatase (SHP-1 or SHP-2) mutant with a mutation in the SH2-domain. Activated mutants of SH2-domain-containing protein tyrosine phosphatases are useful in in vitro assays to screen for binding partners and inhibitors of the phosphatase and in the treatment of Prp-mediated diseases or conditions in a mammal, including neoplastic disorders, obesity and to inhibit angiogenesis. Inhibitors identified using the activated immunostimulation, hematopoletic stimulation and anti-allergy
                                                                                                                                                                                                                                                                                       Sequence 1788 BP; 435 A;
                                                                                                                                                                                                                                                                                                                                                  treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutant SH2 domain-containing protein tyrosine phosphatase, useful in in
vitro assays to screen for binding partners, inhibitors of tyrosine
phosphatase and for treating tyrosine phosphatase-mediated diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 18; 161pp; English.

Searched: 112892 seqs, 41476328 residues

Total number of hits satisfying chosen parameters: 112892

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protyrosine + phosphate.

tyrosine + phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

SUBCELLULAR LOCATION: 2 PROTEIN-TYROSINE PHOSPHATASE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                 197

J. BIOL. THIS PTPASE ACTIVITY
-I- PUNCTION: PLAYS A KEY ROLE IN HEMATOPOIESIS. THIS PTPASE ACTIVITY
MAY DIRECTLY LINK GROWTH FACTOR RECEPTORS AND OTHER SIGNALING
PROTEINS THROUGH PROTEIN-TYROSINE PHOSPHORYLATION. THE SH2 REGIONS
MAY INTERACT MITH OTHER CELLULAR COMPONENTS TO MODULATE ITS OWN
PHOSPHATASE ACTIVITY AGAINST INTERACTING SUBSTRATES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell protein-tyrosine phosphatase (Hcph) Cell 73:1445-1454(1993).

HSSP; Q06124; 2SHP.
                                                           -!- ALTERNATIVE PRODUCTS: 2 Isoforms; a long form (shown here) and short form; are produced by alternative splicing.
-!- TISSUE SPECIFICITY: SELECTIVELY EXPRESSED IN A SUBSET OF AXONS PIONEER NEURONS IN THE EMBRYO.
-!- SIMILARITY: CONTAINS 12 FIBRONECTIN TYPE III-LIKE DOMAINS.
-!- SIMILARITY: CONTAINS 1 PROTEIN-TYROSINE PHOSPHATASE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Three receptor-linked protein-tyrosine phosphatases are selectively expressed on central nervous system axons in the Drosophila embryo."; Cell 67:675-685(1991).

FUNCTIONS DOWNSTREAM OF THE RECEPTOR TYROSINE KINASE TORSO, ACTING IN CONCERT WITH D-RAF VIA TAILLESS. ALSO FUNCTIONS (FIRSTREAM OF EGFR (EPIDERWAL GROWTH FACTOR RECEPTOR) AND BTL CSW EFFECTS ITS ROLE BY MEDIATING HETEROMERIC PROTEIN INTERACTIONS. MATERNALLY REQUIRED FOR NORMAL DETERMINATION OF CELL FATES AT THE TERMINI OF THE EMBRYO. REQUIRED FOR CELL FATE CHS AND FOR EMBRYONIC TRACHEAL ECTODERM, IN THE DEVELOPING EMBRYONIC IMAGINAL DEVELOPMENT FOR PROPER FORMATION OF ADULT STRUCTURES SUCH AS EYES, ARISTAE, LS WING VEIN AND THE TARSAL CLAW.

-i- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           L; AE003423; AAF45724 1; AE003423; AA622389 1; AE003423; AA62728 1; AL; AE003423; AAF45725 1; AL132797; CAB65870 1; AL132797; CAB65871 1; AL132797; AL13

MISCELLANEOUS: THE PTPASE DOMAIN IS INTERRUPTED BY A PTPASE INSERT

WHICH SHARES NO HOMOLOGIES WITH OTHER PTPASE PROTEINS. THIS PTPASE
INSERT IS REMINISCENT OF THE KINASE INSERT WITHIN THE KINASE
CATALYTIC DOMAINS OF SEVERAL RECEPTOR TYROSINE KINASES.

SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE PROTEIN-
TYROSINE PHOSPHATASE FAMILY. SUBCLASS THAT CONTAINS SH2 DOMAINS.

SIMILARITY: CONTAINS 2 SH2 DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tyrosine + phosphate.

CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2) tyrosine + phosphate,
SUBCELLULAR LOCATION: Cytoplasmic.
PTM: PHOSPHORYLATED BY TYROSINE-PROTEIN KINASES.
SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE TYROSINE PHOSPHATASE FAMILY. SUBCLASS THAT CONTAINS SIMILARITY: CONTAINS 2 SH2 DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (Protein-tyrosine phosphatase Syp).

CATALITIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate.

tyrosine + phosphate.

SUBCELLULAR LOCATION: Cytoplasmic.

TISSUE SPECIFICITY: WIDELY EXPRESSED IN HUMAN TISSUES;

PARTICULARLY ABUNDANT IN HEART, BRAIN, AND SKELETAL MUSCLE.

RT "Purification and characterization of a rat liver protein-tyrosine RT phosphatase with sequence similarity to src-homology region 2.";
CT : FUNCTION: THIS PTPASE ACTIVITY MAY DIRECTLY LINK GROWTH FACTOR RECEPTORS AND OTHER SIGNALING PROTEINS THROUGH PROTEIN-TYROSINE CC RECEPTORS AND OTHER SIGNALING PROTEINS THROUGH PROTEIN-TYROSINE CC INTERACTING SUBSTRATES.
CC INTERACTING SUBSTRATES.
CC -I-CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein CC -I-SUBCELULIAR LOCATION: Cytoplasmic (By similarity).
CC -I-TM: PHOSPHORYLATED BY TYROSINE-FROTEIN KINASES (BY SINILARITY).
CC -I-SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE PROTEIN-
CC -I-SIMILARITY: CONTAINS 2 SH2 DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 14
